1 INTRODUCTION

The Wambo Coal Mine is an open cut and underground coal mining operation located approximately 15 kilometres (km) west of Singleton, near the village of Warkworth, New South Wales (NSW). The Wambo Coal Mine is owned and operated by Wambo Coal Pty Limited (WCPL), a subsidiary of Peabody Energy Australia Pty Limited.

The North Wambo Underground Mine is a component of the approved Wambo Coal Mine. The North Wambo Underground Mine commenced in 2005 and involves extraction of coal by longwall mining methods from the Wambo Seam within Mining Lease (ML) 1402, ML 1594, Coal Lease 397 and Consolidated Coal Lease 743 (**Figures 1 and 2**).

The potential environmental impacts of the existing Wambo Coal Mine were assessed in the *Wambo Development Project Environmental Impact Statement* (the Wambo Development Project EIS) (WCPL, 2003). Development Consent DA 305-7-2003 for the Wambo Coal Mine was granted on 4 February 2004 by the then NSW Minister for Urban Affairs and Planning under Part 4 of the NSW *Environmental Planning and Assessment Act, 1979*.

An application to modify the Development Consent (DA 305-7-2003 MOD 2) was lodged in January 2005 to facilitate the re-orientation of the North Wambo Underground Mine longwall panels and allow access to the Wambo Seam via the open cut highwall and was approved on 4 May 2005. The application was accompanied by the *Wambo Development Project – Wambo Seam Underground Mine Modification Statement of Environmental Effects* (North Wambo SEE) (WCPL, 2005).

A subsequent application to modify the Development Consent (DA 305-7-2003 MOD 13) was lodged in December 2012 to allow an extension to the approved North Wambo Underground Mine to include two additional longwalls (Longwalls 9 and 10) and was approved on 8 July 2013. The application was accompanied by the *North Wambo Underground Mine Modification Environmental Assessment* (North Wambo Modification EA) (WCPL, 2012).

An application to modify the Development Consent (DA 305-7-2003 MOD 14) was lodged in September 2014 to allow a minor extension to the approved North Wambo Underground Mine to include an additional longwall (Longwall 10A). The application was accompanied by the *North Wambo Underground Mine Longwall 10A Modification Environmental Assessment* (North Wambo Longwall 10A Modification EA) (WCPL, 2014).

A Subsidence Management Plan (SMP) for Longwalls 1 to 6 at the North Wambo Underground Mine (WCPL, 2006) was approved by the NSW Department of Primary Industries – Mineral Resources on 11 December 2006. An Extraction Plan for Longwalls 7 and 8 was approved by the NSW Department of Planning and Infrastructure (DP&I) for Longwall 7 on 16 May 2013 and for Longwall 8 on 24 September 2013. Subsequently, a revised Extraction Plan for Longwalls 7 to 10 was approved by the Department of Planning and Environment on 4 July 2014.

The approved Extraction Plan for Longwalls 8 to 10 has been revised to include the remaining longwall within the North Wambo Underground Mine extent (Longwall 10A) for a consolidated Extraction Plan for Longwalls 8 to 10A (**Figures 1 and 2**).

1.1 PURPOSE AND SCOPE

Purpose: This Coal Resource Recovery Plan for Longwalls 8 to 10A has been prepared to demonstrate the effective recovery of the available resource at the North Wambo Underground Mine.

Scope: This Coal Resource Recovery Plan includes Longwalls 8 to 10A of the North Wambo Underground Mine.

This Coal Resource Recovery Plan has been prepared in accordance with Condition 22C(g) of Schedule 4 of the Development Consent (DA 305-7-2003) as a component of the North Wambo Underground Mine Longwalls 8 to 10A Extraction Plan. Condition 22C(g) of Schedule 4 of the Development Consent (DA 305-7-2003) requires:

> *22C. The Applicant shall prepare and implement an Extraction Plan for the second workings within each seam to be mined to the satisfaction of the Secretary. Each Extraction Plan must:*
>
> *...*
>
> *(g) include the following to the satisfaction of the DRE:*
>
> - *a coal resource recovery plan that demonstrates effective recovery of the available resource.*
>
> *...*

Plans 1 to 7 as described in the Draft *Guidelines for the Preparation of Extraction Plans Required under Conditions of Development Consents, Project Approvals and Mining Lease Conditions for Underground Coal Mining* (Version 5) (Department of Planning and Environment and NSW Trade & Investment – Division of Resources and Energy, 2015) are provided in **Attachment 1**. **Plan 1**, **Plan 2** and the **Plan 7** (**Attachment 1**) present the proposed mine plan, Longwalls 8 to 10A Application Area and surface features overlying Longwalls 8 to 10A. **Plan 5** presents the current WCPL mining tenements and details land ownership.

This Coal Resource Recovery Plan forms part of WCPL's Environmental Management System for the Wambo Coal Mine. The relationship of this Coal Resource Recovery Plan to the Wambo Coal Mine Environmental Management System is described in Section 1.2 of the Extraction Plan.

2 RESOURCE DESCRIPTION

2.1 SITE GEOLOGY OVERVIEW

The Wambo Coal Mine is situated within the Hunter Coalfield subdivision of the Sydney Basin, which forms the southern part of the Sydney-Gunnedah-Bowen Basin (WCPL, 2003). The coal bearing rocks of the Sydney Basin are Permian in age and are typically associated with low-lying gentle topography (WCPL, 2003). The overlying rocks of Triassic age cover large parts of the Sydney Basin and tend to form prominent escarpments where they outcrop (WCPL, 2003).

Mining activities at the Wambo Coal Mine include both open cut and underground mining of several coal seams from the Wittingham Coal Measures, which combine with the Newcastle Coal Measures to form the Singleton Supergroup (**Figure 3**). A summary of the coal measure stratigraphy underlying the Wambo Coal Mine area is provided in **Figure 3**.

Wittingham Coal Measures are divided into the Jerrys Plains Subgroup, Vane Subgroup, Denman Formation and Archerfield Sandstone (WCPL, 2003). The Jerrys Plains Subgroup contains eight formations with 15 named coal seams (WCPL, 2003). The Jerrys Plains Subgroup is up to 800 metres (m) thick and generally consists of relatively coarse clastic sediments (DMR, 1993). The sedimentary rock layers above and between coal seams are typically lithic sandstone, siltstone and conglomerate, while minor carbonaceous claystone and tuff occurs throughout the sequence (WCPL, 2003).

Coal seams previously, currently and proposed to be mined at the Wambo Coal Mine include (**Figure 3**):

- Whybrow Seam;
- Redbank Creek Seam;
- Wambo Seam;
- Whynot Seam;
- Arrowfield Seam; and
- Bowfield Seam.

These seams dip gently to the south-west at approximately 2 to 3 degrees with minor local variations due to varying thicknesses of inter-seam sediments and fault zones (WCPL, 2003). Faulting usually trends north or north-east to south-west with normal throws of up to 10 m with some low angle thrusts (i.e. reverse faults) of variable throw (MineConsult, 2001).

The North Wambo Underground Mine mines the Wambo Seam which produces a low ash thermal coal (WCPL, 2003). Run-of-mine (ROM) coal is crushed and washed at the Wambo Coal Mine coal handling and preparation plant. Product coal from the North Wambo Underground Mine is considered suitable for export and domestic markets.

2.2 OVERBURDEN LITHOLOGICAL AND GEOTECHNICAL CHARACTERISTICS

The overburden of the Longwalls 8 to 10A Application Area consists of gently, south-west dipping sedimentary strata comprising medium strength thin to medium interbedded sandstone and siltstone with some thickly bedded sandstone units (Ditton Geotechnical Services [DgS], 2012; Mine Subsidence Engineering Consultants [MSEC], 2014a; MSEC, 2014b).

SUPERGROUP	GROUP	SUBGROUP	FORMATION	SEAM

WAMBO COAL MINE

FIGURE 3
Stratigraphy of the
Wambo Coal Mine Area

Peabody ENERGY

The typical stratigraphy over the longwalls indicates the presence of several sandstone strata units that are 2 to 43 m thick and located 0.2 m to 185 m above the Wambo Seam (MSEC, 2014a). The sandstone unit that is most likely to reduce subsidence is approximately 25 m to 35 m thick and is 47 m to 61 m above the Wambo Seam (DgS, 2012).

Estimates of the range of material strength and stiffness properties present in the overburden materials are summarised in **Table 1**. A geotechnical model of the strata within the North Wambo Underground Mine area is presented in **Figure 4**.

Table 1
Strength Property Estimates for Lithology in the Vicinity of the North Wambo Underground Mine

Unit Lithology	Unit Thickness Range (m)	UCS Range (MPa)	Laboratory Elastic Modulus* Range (GPa) [mean]	Poisson's Ratio
Massive Sandstone Units	5 - 35	40 - 60	12 - 18 [15]	0.25
Interbedded Sandstone/ Siltstone Beds above and below the Coal Seams	5 - 20	20 - 40	6 - 12 [9]	0.25
Carbonaceous Mudstone Beds above and below the Coal Seams	1 - 2	2 - 20	0.6 - 6 [3]	0.25 - 0.30
Coal Seams	2 - 3	7 - 14	2.0 - 4.0 [3]	0.25 - 0.35

Source: After DgS (2012).

* Young's Modulus (E) derived from laboratory and sonic UCS data, E = 300 x UCS (units are in GPa).

Note: UCS = unconfined compressive strength.
MPa = megapascal.
GPa = gigapascal.

2.3 LITHOLOGICAL AND GEOTECHNICAL CHARACTERISTICS (ROOF AND FLOOR STRATA)

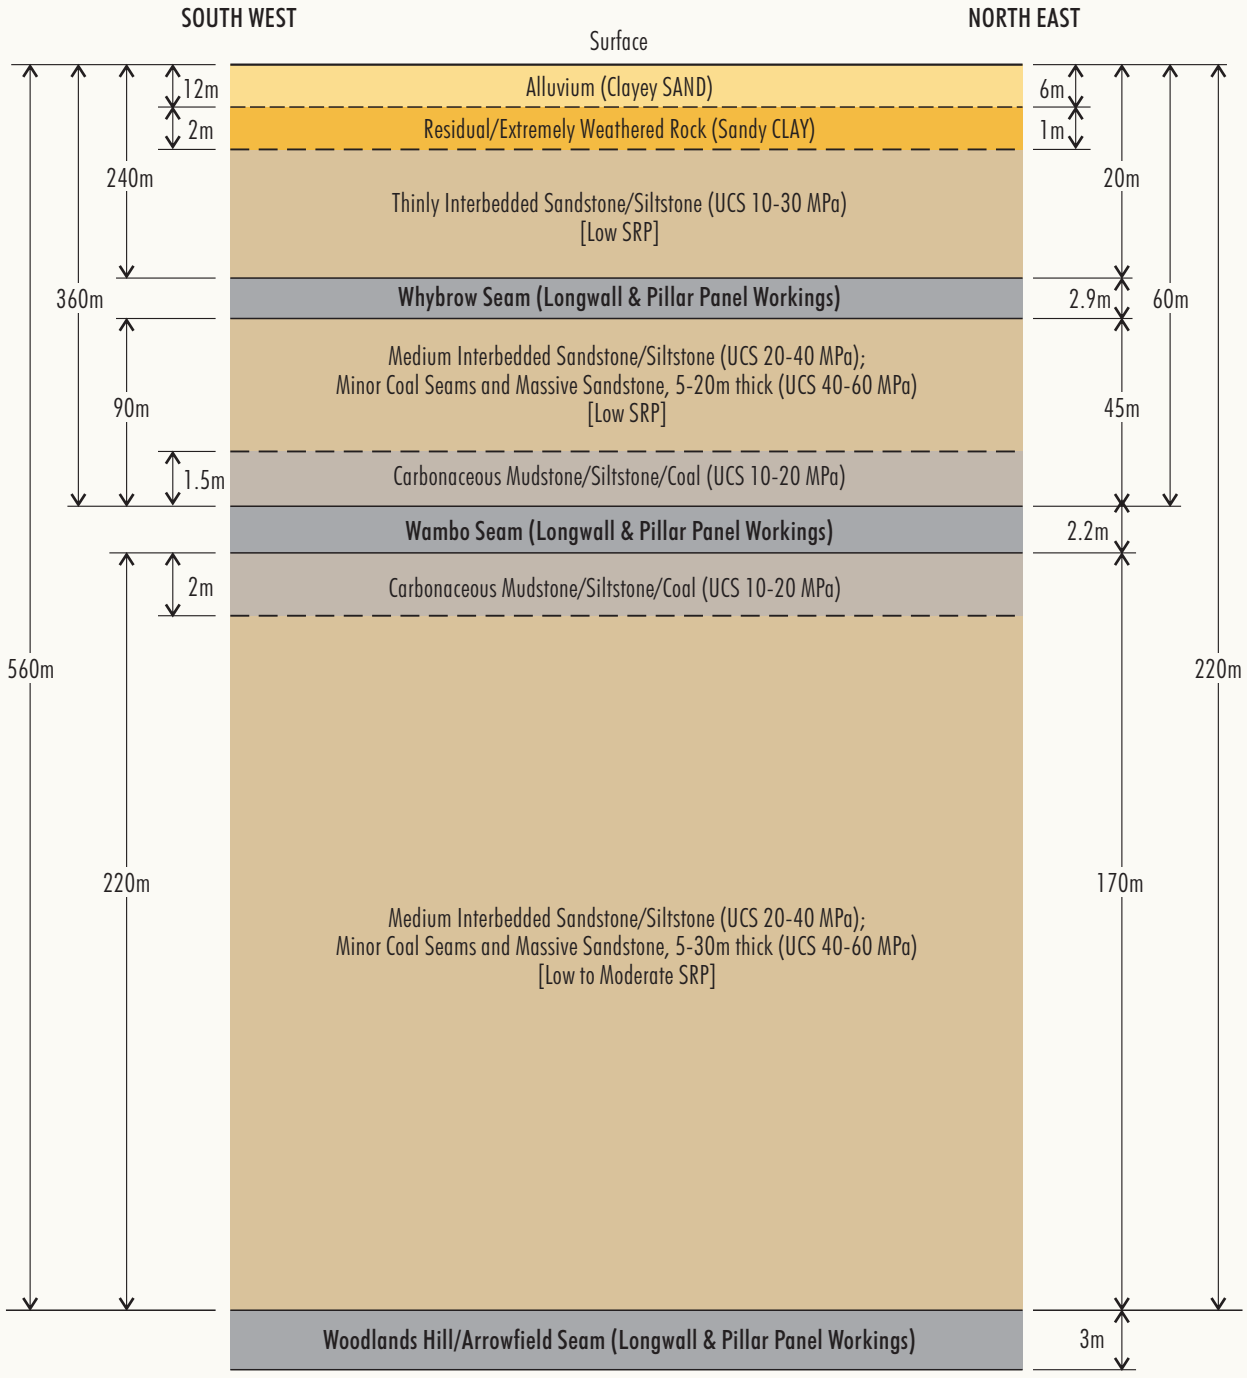
Low strength carbonaceous mudstone, mudstone and coal immediately overly and underlie the coal seams present in the overburden in the Wambo Coal Mine area (DgS, 2012). Previously mined seams in the vicinity of the North Wambo Underground Mine include (in descending order) the Whybrow Seam, Wambo Seam and Woodlands Hill/Arrowfield Seams.

Historical workings are discussed further in **Section 2.6**.

The coal seams mentioned above, generally have low strengths, with sonic derived UCS values ranging from 7 to 14 MPa, and some low to high strength stone bands up to 0.1 m thick are also present within these seams (DgS, 2012).

The immediate roof and floor of the mining horizons typically consist of medium strength, fine grained to medium grained sandstone (MSEC, 2014a).

Estimates of the range of material strength and stiffness properties present in the roof and floor of the mine workings coal seams are summarised in **Table 1**. A geotechnical model of the strata within the North Wambo Underground Mine area is presented in **Figure 4**.



Note: SRP = Subsidence Reduction Potential
UCS = Unconfined Compressive Strength

FIGURE 4
Geotechnical Model of the Strata within the North Wambo Underground Mine Area

Not to Scale

2.4 EXISTENCE AND CHARACTERISTICS OF GEOLOGICAL STRUCTURE

Regional geological structure in the study area consists of one major and minor fault. The major fault is a north to south trending fault which crosses the middle of Longwalls 9, 10 and 10A with a throw of approximately 1 m (see **Technical Reports 1 and 2** of the Extraction Plan [MSEC, 2014a; MSEC 2014b]). The minor fault is located in the northern section of Longwall 9, trending from the south-west to north-east with a throw of less than 0.3 m (MSEC, 2014a). The largest structure in the area is the Redmanvale Fault, which has a throw greater than 20 m. This fault is located more than 1.5 km south-west of the proposed longwalls (MSEC, 2014a).

2.5 STABILITY OF UNDERGROUND WORKINGS

The design intent of the workings and method of extraction is such that the first workings provide long-term stable access to the longwall blocks or pillar panels, and the second workings are mined such that the overburden collapses (i.e. "goafs") in a controlled manner as the coal is removed. All of the subsidence movements that occur at the surface are generally the result of a new equilibrium being achieved (i.e. chain pillars and overlying strata compress elastically and overburden caves and eventually ‘re-supports’ itself on bulked and broken ground).

The Division of Resources and Energy indicated it was satisfied WCPL would achieve the required outcomes of the first workings condition of the Development Consent (DA 305-7-2003, Condition 22E of Schedule 4) for Longwalls 9 and 10 on 6 September 2013 subject to the following condition:

> *The Mine Manager must undertake adequate monitoring of the stability of first workings in the subject area and to implement appropriate ground support of roadways in accordance with the results of the said monitoring, to ensure compliance with the outcome requirements of condition 22E of Schedule 4 of DA 305-7-2003.*

Subsequently, the Division of Resources and Energy indicated it was satisfied WCPL would achieve the required outcomes of the first workings condition of the Development Consent (DA 305-7-2003, Condition 22E of Schedule 4) for Longwall 10A on 26 May 2014 subject to the following condition:

> *The Mine Manager must undertake adequate monitoring of the stability of first workings in the subject area and to implement appropriate ground support of the roadways in accordance with the results of the said monitoring, to ensure compliance with the outcome requirements of condition 22E of Schedule 4 of DA 305-7-2003.*

The longwall blocks are also designed with barrier pillars at the ends of the blocks to protect the adjacent first workings pillars and remnant pillars left between the augered areas from any abutment loading. Adequate set-back from highwall crests is also provided.

The chain pillars are designed to provide serviceable gate roads for access and ventilation and may yield or crush out after mining is completed.

2.6 HISTORICAL MINING

There are a number of previous workings in the vicinity of Longwalls 8 to 10A including (**Figure 2**):

- Bord and pillar workings in the Wambo Seam to the south-east of Longwall 8.
- Bord and pillar workings and extracted longwall panels associated with the Homestead Mine and the Wollemi Mine in the Whybrow Seam, located approximately 45 to 95 m above the Wambo Seam.

- Extracted longwall panels associated with the United Mine in the Woodlands Hill/Arrowfield Seam (under a lease swap arrangement), located approximately 170 to 220 m below the Wambo Seam.

Longwall 8 is located within the inrush control zone associated with the historical bord and pillar workings in the Wambo Seam. Relevant monitoring and management measures are detailed in the Inrush Management Plan. Management measures include maintaining a geotechnically-stable barrier between Longwall 8 and the previous workings and inseam drilling to define the integrity of the barrier and dewatering of old workings to reduce inrush hazard to a level as low as reasonably practicable.

Longwalls 8 to 10A also underlie previous workings of the Homestead Mine in the Whybrow Seam. Water had accumulated in these overlying workings and therefore, the inrush of water to Longwalls 8 to 10A resulting from hydraulic connection with the previous workings is considered to be a potential hazard. For this reason dewatering of the previous workings in the Whybrow Seam is undertaken in advance of active mining as a safety measure and in accordance with Condition 5.3 of the *Clause 88(1) Coal Mine Health and Safety Regulation 2006 Approval to Extract Longwalls 7 to 10, Wambo Seam, North Wambo Coal Mine* (dated 27 May 2013).

The extraction of Longwalls 8 to 10A is expected to result in goaf reactivation of the previous workings of the Homestead Mine in the overlying Whybrow Seam. Multi-seam interaction potential associated with the extraction of Longwalls 8 to 10A has been assessed by DgS (2012), MSEC (2014a) and MSEC (2014b).

DgS (2012) found that it is unlikely that multi-seam interaction effects will cause instability of the existing standing pillars. Notwithstanding, sections of the previous workings of the Homestead Mine in the Whybrow Seam above Longwall 8 will be bulk filled with low strength grout. This grouting is proposed primarily as a mitigation measure to minimise the potential for flooding due to chimney failure and pot hole development resulting from failure of remnant pillars within the Homestead Mine workings. The bulk filling/grouting will be undertaken within historical workings of the Homestead Mine which underlie alluvium above Longwall 8. The bulk filling/grouting will be completed prior to secondary extraction of Longwall 8 within these areas. Further detail regarding the bulk filling/grouting is provided in the main report of the Extraction Plan.

3 RESOURCE RECOVERY

3.1 MINING GEOMETRY

The currently approved orientation and footprint of the North Wambo Underground Mine was assessed as part of the North Wambo SEE (WCPL, 2005), the North Wambo Modification EA (WCPL, 2012), and the North Wambo Longwall 10A Modification EA (WCPL, 2014).

Longwalls 8 to 10A are the four remaining longwalls within the North Wambo Underground Mine extent.

The layout of Longwalls 8 to 10A is presented in **Plan 1** (**Attachment 1**) and a summary of the key panel dimensions for Longwalls 8 to 10A is presented in **Table 2**.

Table 2
Key Longwall Panel Dimensions

Dimension	Longwall 8	Longwall 9	Longwall 10	Longwall 10A
Gate Road Width (m)	5.4	5.4	5.4	5.4
Gate Road Height (m)	2.5 – 2.8	2.5 – 2.8	2.5 – 2.8	2.5 – 2.8
Maingate Chain Pillar Width (m)	16.8 (for single abutment loading) 26.2 (for double abutment loading)[1]	26.2	26.2	26.2
Tailgate Chain Pillar Width (m)	26.2	26.2	26.2	26.2
Tailgate Chain Pillar Length (m)	94.6	94.6	94.6	94.6
Longwall Void Width (m)	262.8	262.8	262.8	262.8
Longwall Void Length (m)	Longwall 8a – 1,782 Longwall 8b – 812.5[2]	1,748.5	1,763.7	1,508.8
Extraction Height (m)	2.2 – 2.5	2.3 – 2.6	2.3 – 2.6	2.2 – 2.6

[1] A portion of the Longwall 8 maingate pillar has been designed for double abutment loading for Longwall 9.

[2] Excludes the Wambo Homestead Exclusion Zone (WHEZ) as shown in **Figures 1 and 2** and discussed in **Section 3.7**.

3.2 COVER DEPTH

The cover depth above the proposed Longwalls 8 to 10A in the Wambo Seam ranges from 60 m to 240 m (DgS, 2012; MSEC, 2014a; MSEC, 2014b). The cover depth increases to the south-west, consistent with the seam dip. In comparison, the cover depth above Longwalls 1 to 6 as described in the SMP for Longwalls 1 to 6 ranges from 50 m to 360 m.

3.3 MINING METHOD

Longwalls 8 to 10A will be extracted using retreating longwall mining methods for secondary extraction of 263 m wide panels. Construction of development main headings, maingates and tailgates are undertaken using continuous miners.

3.4 MINING SCHEDULE

The North Wambo Underground Mine operates seven days a week, 24 hours a day on a rotating shift basis. At the date of this document, extraction of Longwalls 1 to 7, 8a and 9 is complete, with extraction of Longwall 10 underway. The proposed sequence of mining under the Extraction Plan and anticipated start and completion dates are summarised in **Table 3**.

Table 3
Proposed Mining Schedule (Secondary Extraction)

Longwall	Estimated Start Date	Estimated Duration	Estimated Completion Date
Longwall 8a	February 2014 (actual)	5 months	July 2014 (actual)
Longwall 9	August 2014 (actual)	5 months	January 2015 (actual)
Longwall 10	January 2015 (actual)	4 months	June 2015
Longwall 10A	June 2015	5 months	October 2015
Longwall 8b	November 2015	3 months	January 2016

3.5 FUTURE MINING

A SMP for Longwalls 1 to 6 at the North Wambo Underground Mine (WCPL, 2006) was approved by the Department of Primary Industries – Mineral Resources on 11 December 2006. The Extraction Plan for Longwalls 7 and 8 was revised in February 2014 to include Longwalls 9 and 10. The approved Extraction Plan has been revised further to incorporate Longwall 10A within the North Wambo Underground Mine.

In addition to the North Wambo Underground Mine, the Development Consent (DA 305-7-2003) provides consent for underground mining by longwall methods in the Whybrow, Arrowfield and Bowfield Seams (**Figure 1**). The approved future workings in the Arrowfield and Bowfield Seams underlie the North Wambo Underground Mine workings as shown on **Figures 1 and 4** and **Plan 1**. Approved future mining in the Whybrow Seam is located more than 2 km north-west of Longwalls 8 to 10A. The approved future underground longwall workings are described in the Wambo Development Project EIS (WCPL, 2003).

A Preliminary Environmental Assessment for a modification of the Development Consent (DA 305-7-2003) including the realignment and extension/relocation of the Arrowfield and Bowfield Seam Underground Mines (referred to as the South Wambo Underground Mine Modification) was lodged on 10 September 2012. Director-General's Requirements for the South Wambo Underground Mine Modification Environmental Assessment were issued by the DP&I on 25 October 2012. The South Wambo Underground Mine Modification Environmental Assessment would include justification of a modification to the currently approved layout of the Arrowfield and Bowfield Seam Underground Mines.

Further to underground mining activities the Development Consent (DA 305-7-2003) provides consent for open cut mining. The seams approved for open cut mining include the Whybrow, Redbank Creek, Wambo and Whynot Seams.

Mining of the Wambo Seam by open cut mining methods in the North Wambo Underground Mine area is not economically viable due to past removal of the overlying Whybrow Seam (WCPL, 2006).

3.6 RESOURCE RECOVERY

Resource estimates and proposed recovery for Longwalls 8 to 10A are summarised in **Table 4**. The proposed mining layout for Longwalls 8 to 10A maximises resource recovery within the approved layout. The recovery of available resource of the proposed Longwalls 8 to 10A layout is estimated to be approximately 81% excluding the resource sterilised by the Wambo Homestead Exclusion Zone (WHEZ).

Table 4
Estimated Resource Recovery from Longwalls 8 to 10A

Aspect	Million Tonnes
Available Resource (including WHEZ)	10.919
Available Resource (excluding WHEZ)	10.727
Development ROM Coal	0.567
Longwall ROM Coal	8.052
Total ROM Coal Recovered	**8.619 (80.3%)**

WHEZ – Wambo Homestead Exclusion Zone.

The Development Consent (DA 305-7-2003) provides for underground mining in three seams in addition to the Wambo Seam: the proposed South Bates Underground Mine (in the Whybrow Seam); and the underlying Arrowfield and Bowfield Seam Underground Mines.

The extraction of Longwalls 8 to 10A will result in subsidence impact on the overlying strata. The overlying strata includes historical workings in the Whybrow Seam. The sequence and orientation of the North Wambo Underground Mine has been adopted to minimise the impact on resource recovery from the approved South Bates Underground Mine which is located more than 2 km north-west of Longwalls 8 to 10A and approximately 300 m from Longwall 1 at its closest point (**Figure 1**). In addition, the extraction of Longwalls 8 to 10A is not expected to impact the ability of future extraction of the lower Arrowfield and Bowfield Seams.

Extraction of the Redbank Creek Seam above the North Wambo Underground Mine is constrained within the extent of the approved open cut limit (**Figure 1**) as recovery of the Redbank Creek Seam outside of this extent is not considered to be economically viable.

The mine plan design of the North Wambo Underground Mine (including Longwalls 1 to 10A) included consideration of multi-seam extraction.

3.7 MINE PLAN JUSTIFICATION

The proposed sequence of underground mining at the Wambo Coal Mine has been adopted to minimise the potential for sterilisation of coal reserves. The **Approved Plan** (**Attachment 1**) presents the Longwalls 8 and 10A layout which has been developed in consideration of detailed exploration drilling and key environmental studies as described in the Wambo Development Project EIS, the North Wambo SEE, the North Wambo Modification EA, and the North Wambo Longwall 10A Modification EA.

The Wambo Development Project EIS and the North Wambo SEE sought approval to extract the full lengths of Longwalls 7 and 8 as part of the Development Consent (DA 305-7-2003). However, in accordance with Condition 57 of Schedule 4 of the Development Consent (DA 305-7-2003) an approval of an application under section 60 of the NSW *Heritage Act, 1977* is required prior to mining within the curtilage of the Wambo Homestead Complex[1]. Approval of the application under section 60 of the *Heritage Act, 1977* for longwall mining within the curtilage of the Wambo Homestead Complex included the exclusion of longwall mining within the WHEZ located above the proposed Longwall 8 (**Figure 1**). The WHEZ is discussed further in Section 1.6.1 of the Extraction Plan.

The monitoring of subsidence impacts associated with the extraction of Longwalls 8 to 10A is described in the Subsidence Monitoring Program for Longwalls 8 to 10A (Appendix H of the Extraction Plan) and the relevant management plans summarised in Section 3 of the Extraction Plan.

[1] The Wambo Homestead Complex curtilage is the boundary of the State Heritage Register of NSW listing.
